

run_proxy_challenges.sh

Revision: 1 **Last modified:** 2026-07-01T00:00:00Z **Authority:** Helix Constitution §11.4.27 (Challenges), §11.4.69 (sink-side positive evidence), §11.4.1 (script-crash = FAIL), §12.6/§12.9 (host resource caps), §11.4.89 (bounded execution)

Overview

Runner for the helix_proxy forward-proxy anti-bluff Challenge bank. It executes the three challenges — HTTP forward, SOCKS5 forward, Squid cache — against the **live running proxy** under host-safety resource caps, tallies PASS/FAIL/SKIP, and writes a summary plus per-challenge evidence under qa-results/challenges/<run-ts>/. It exits non-zero **only** on a real FAIL; an honest SKIP is not a failure, and an unexpected exit code (e.g. a set -u crash) is conservatively counted as FAIL per §11.4.1.

Prerequisites

- The three sibling challenge scripts present and executable.
- bash; nice / ionice optional (caps degrade gracefully if absent).
- The live proxy stack UP (HTTP 34128, SOCKS5 34080).

Usage

```
bash challenges/scripts/run_proxy_challenges.sh
```

Any per-challenge environment (HTTP_PROXY_URL, SOCKS5_PROXY, CACHE_URL, SQUID_ACCESS_LOG, LOG_DIR, CURL_MAX_TIME, ...) is passed straight through.

Resource caps (host-safety)

Each challenge runs under GOMAXPROCS=2 nice -n 19 ionice -c 3 (§12.6/§12.9). GOMAXPROCS is exported for any Go tooling a challenge might invoke; the shell challenges themselves are lightweight curl clients.

Exit codes

Code	Meaning
0	No FAIL — every challenge was PASS or an honest SKIP.
1	≥ 1 challenge FAILED (a real proxy defect, a missing script, or an unexpected crash).

Outputs

- qa-results/challenges/<run-ts>/summary.txt — tally + per-challenge verdict lines.
- qa-results/challenges/<run-ts>/<name>.log — captured stdout/stderr per challenge.
- qa-results/challenges/<run-ts>/evidence/... — the challenges' captured evidence.

Verdict mapping

Per-challenge exit code $\rightarrow$ tally: 0 $\rightarrow$ PASS, 3 $\rightarrow$ SKIP, anything else $\rightarrow$ FAIL.

Related scripts

- proxy_forward_http_challenge.sh, proxy_socks5_challenge.sh, proxy_cache_challenge.sh — the challenges it drives.
- tests/lib/evidence.sh — the sourced anti-bluff helper library.

Last verified: 2026-07-01 (live run: total=3 PASS=2 SKIP=1 FAIL=0, exit 0).
